Inflammation and exercise: Inhibition of monocytic intracellular TNF production by acute exercise via β^2 -adrenergic activation

Inflammation and exercise: Inhibition of monocytic

Main Text Introduction. Physical inactivity is a known, but modifiable, risk factor that contributes to lifestyle-related diseases, including many causes of "preventable death" (Booth et al., 2012). Worldwide, approximately one in three adults and four in five adolescents do not achieve the recommended quantity and quality of daily exercise (Hallal et al., 2012).

Exercise Metabolism and the Molecular Regulation of

Physical exercise is important for maintaining physical fitness and can contribute to maintaining a healthy weight, regulating digestive health, building and maintaining healthy bone density, muscle strength, and joint mobility, promoting physiological well-being, reducing surgical risks, and strengthening the immune system. Some studies indicate that exercise may increase life expectancy and ...

Exercise - Wikipedia

Exercise physiology is the physiology of physical exercise. It is the study of the acute responses and chronic adaptations to exercise. Understanding the effect of exercise involves studying specific changes in muscular, cardiovascular, and neurohumoral systems that lead to changes in functional capacity and strength due to endurance training or strength training.

Abstract. Hormone-sensitive lipase (HSL) is an intracellular neutral lipase that is capable of hydrolyzing triacylglycerols, diacylglycerols, monoacylglycerols, and cholesteryl esters, as well as other lipid and water soluble substrates.

Activation of AMP-activated kinase (AMPK) in skeletal muscle increases glucose uptake, fatty acid oxidation, and mitochondrial biogenesis by increasing gene expression in these pathways. However, the transcriptional components that are directly targeted by AMPK are still elusive. The peroxisome-proliferator-activated receptor γ coactivator 1 β (PGC-1 β) has emerged as a master regulator of ...
