Schwarzschild embedding diagram, which is the wormhole analogue for a static, non-rotating, Schwarzschild black hole. An observer passing through such a wormhole could, in principle, traverse the wormhole in less time than it would take to travel from point A to point B through normal space-time outside the wormhole.

2 with determining the BH mass and k the horizon topology. For $k = 1$, $d = 2$ is the metric on the unit sphere. For the $k = 0$ solution, $d = 2$ is a planar metric. For $k = 1$, $d = 2$ is the unit hyperboloid metric $dr^2 + \cosh^2 r d\tilde{E}^2$ [16, 17] and near the throat at $r = 0$, the boundary metric is conformal to a cylinder.

The region near $u = 0$ is known as the "wormhole". We also note that for this bridge construction we must take $m > 0$, as if we have assumed $m < 0$, our bridge construction will fail since we require the existence of a horizon for this coordinate transformation to work. Einstein and Rosen concluded that this bridge

wormhole to be discernible, and at least 2 dimensions of space are required for wormholes to exist between points on a connected manifold. Our main result is that the process of creating a particle-antiparticle pair in this theory can be reinterpreted as the process of creating a wormhole.
